Why Buy a Screen?

A quality projection screen is the only way you can correctly view the color slides or color movies you've taken. Walls, sheets or window shades simply won't give you the perfectly flat, unmarred surface you need to show up images at their sharpest, colors at their best. Only a quality screen can inject the brightness, clarity and depth that brings your slides and movies to life in full color.

Why a Knox Screen?

Simply because Knox screens are built better. Screen fabrics are rugged and durable. Our fiberglass fabrics are almost impossible to scuff or tear. Fiberglass is fireproof, mildew-proof, unaffected by temperature and humidity changes. Our screen lies perfectly flat for flawless viewing. Our exclusive convenience features, such as K-Matic automatic leg opening *and* closing, make Knox screens easy to use and convenient to store.

Which Type of Screen?

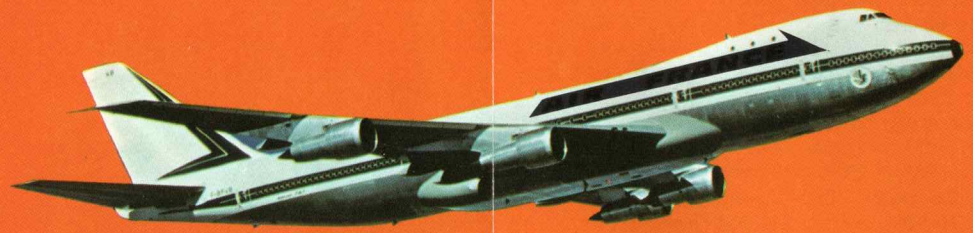
1.) *Micro-beaded* — Formed by thousands of tiny optical glass beads bonded to our special vinyl surface, this is the screen to use if you can completely darken your viewing room. Knox micro-beaded screens outperform all competitors for the brightest picture ever!

2.) *Silver Lenticular* — If you cannot darken your viewing area, or if you must view your screen from odd angles, you need a Knox silver lenticular screen. Its dual, horizontal/vertical pattern provides the finest viewing surface for maximum clarity and minimum grain at any viewing angle — even in partially lighted rooms. The Knox lenticular screen pattern has been selected for use in most Boeing 747 Super Jets.

3.) *Matte White* — When a wide viewing angle and close-up definition of detail is more important than brightness, choose a Knox matte white screen. Its heavyweight vinyl or fiberglass surface is lightly embossed and specially treated for optimum viewing.

What Size Screen?

A good rule of thumb is a 50″ screen for the average size living room, a 60″ screen for the average size recreation room. Increasing screen size does not raise screen cost proportionately. While a 60″ screen is 44% larger than a 50″ screen, it costs only about 17% more, etc. In buying a screen ask your Knox dealer to guide you in your selection.



The lenticular screens in most Boeing 747 Super Jets feature the Knox lenticular screen pattern.
